

PROGRAM 18

AIM: Write a program in Python to implement Madaline Neural Network.

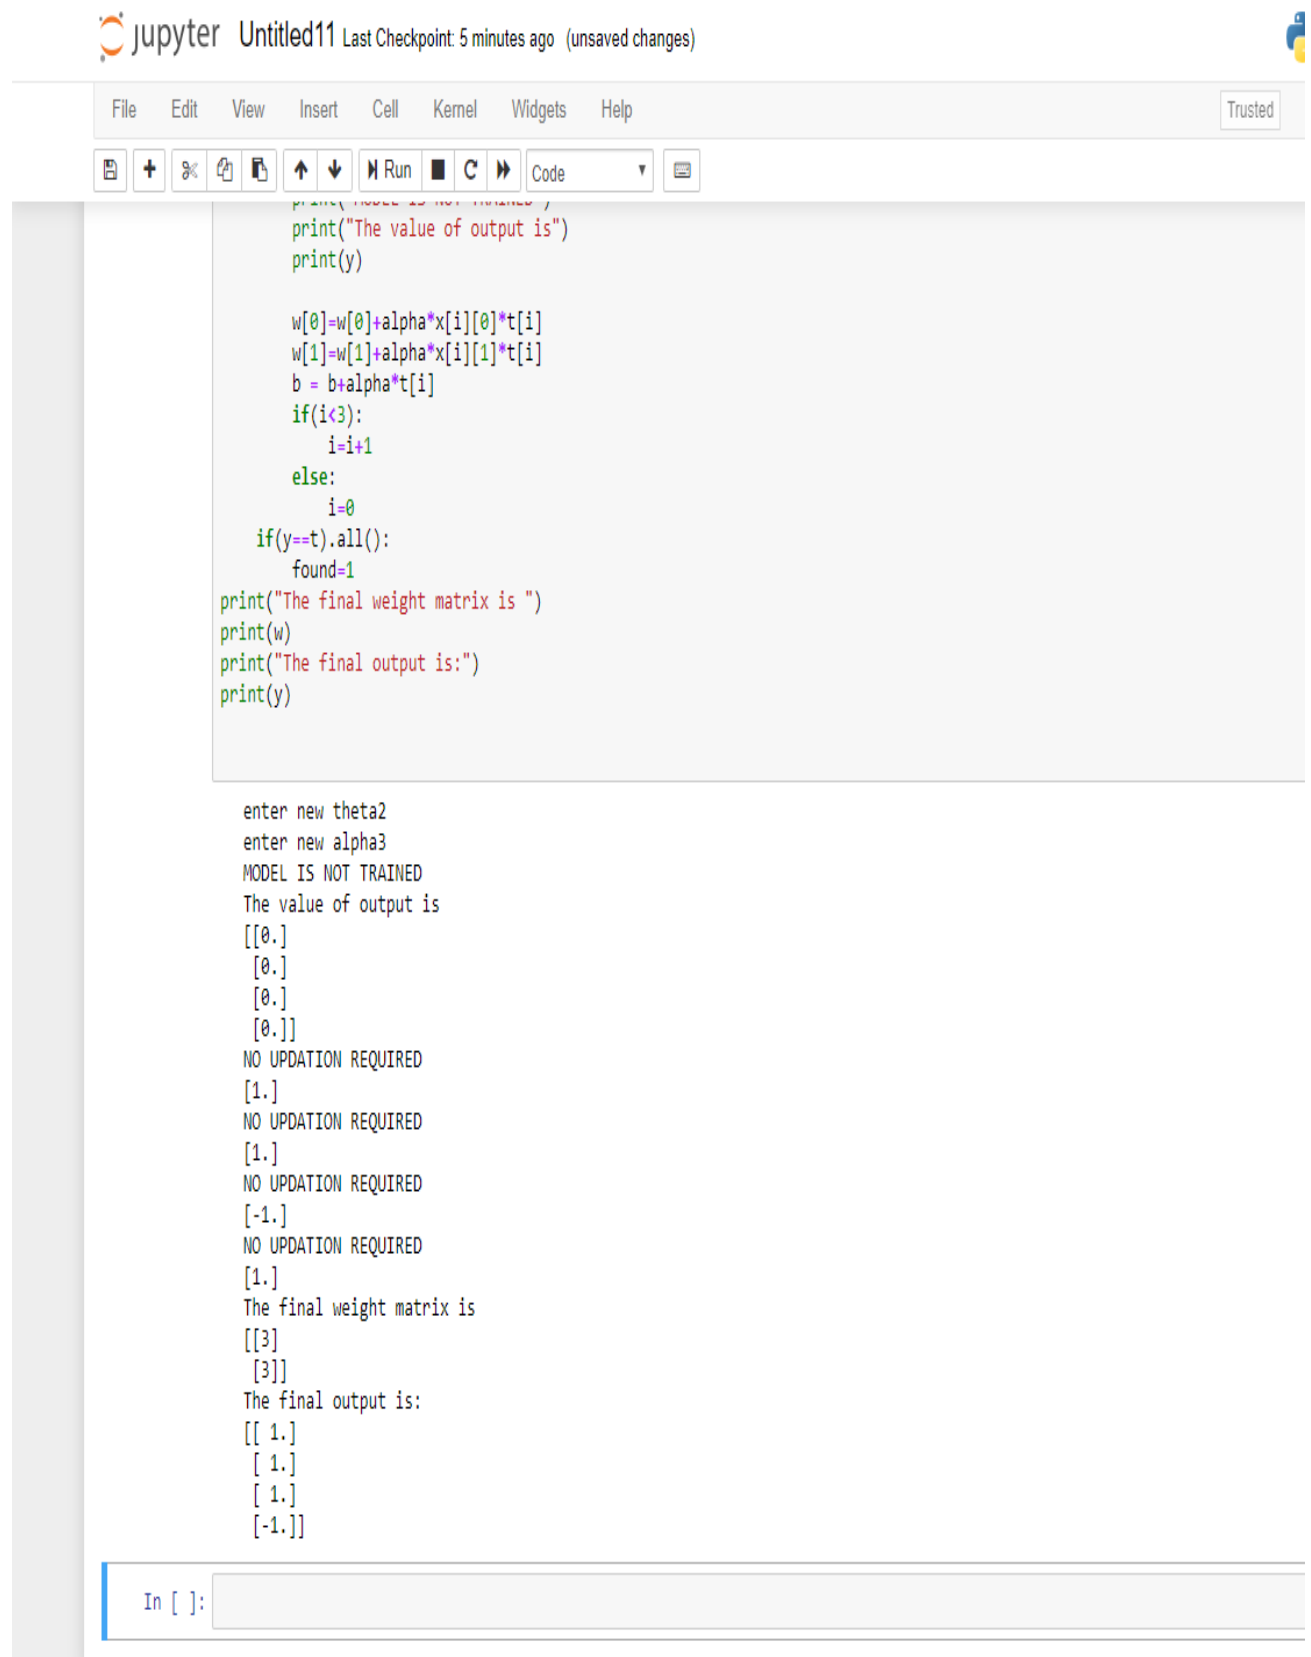

CODE:

```
import numpy as np
x=np.array([[1,1],[1,-1],[-1,1],[-1,-1]])
t=np.array([[1],[1],[1],[-1]])
w=np.array([[0],[0]])
b=0
theta=float(input("enter new theta"))
alpha=float(input("enter new alpha"))
yin=np.zeros(shape=(4,1))
y=np.zeros(shape=(4,1))
i=0
found=0
while(found==0):
    yin=x[i][0]*w[0]+x[i][1]*w[1]
    yin = yin+b
    if(yin>theta):
        y[i] = 1
    elif(yin<=theta and yin>=-theta):
        y[i]=0
    else:
        y[i]=-1
    if (y[i]==t[i]):
        print("NO UPDATION REQUIRED")
        print(y[i])
        if(i<3):
            i=i+1
        else:
            i=0
    else:
        print("MODEL IS NOT TRAINED")
        print("The value of output is")
        print(y)

        w[0]=w[0]+alpha*x[i][0]*t[i]
        w[1]=w[1]+alpha*x[i][1]*t[i]
        b = b+alpha*t[i]
        if(i<3):
            i=i+1
        else:
            i=0
    if(y==t).all():
        found=1
print("The final weight matrix is ")
print(w)
print("The final output is:")
print(y)
```

PROGRAM 18

OUTPUT:

Jupyter Notebook interface showing a Python program for a neural network. The code includes initialization, a loop for training, and final output printing. The output shows the model is not trained, the value of output is [0.], and the final weight matrix and output.

```
print("MODEL IS NOT TRAINED")
print("The value of output is")
print(y)

w[0]=w[0]+alpha*x[i][0]*t[i]
w[1]=w[1]+alpha*x[i][1]*t[i]
b = b+alpha*t[i]
if(i<3):
    i=i+1
else:
    i=0
if(y==t).all():
    found=1
print("The final weight matrix is ")
print(w)
print("The final output is:")
print(y)
```

enter new theta2
enter new alpha3
MODEL IS NOT TRAINED
The value of output is
[[0.]
[0.]
[0.]
[0.]]
NO UPDATION REQUIRED
[1.]
NO UPDATION REQUIRED
[1.]
NO UPDATION REQUIRED
[-1.]
NO UPDATION REQUIRED
[1.]
The final weight matrix is
[[3]
[3]]
The final output is:
[[1.]
[1.]
[1.]
[-1.]]

In []:
