PROGRAM 20

AIM: Write a program in Python to implement single layer perceptron for AND function.

CODE:

```
import numpy as np
x=np.array([[1,1],[1,-1],[-1,1],[-1,-1]])
t=np.array([[1],[1],[1],[-1]])
w=np.array([[0],[0]])
b=0
theta=float(input("Enter new theta:"))
alpha=float(input("Enter new alpha:"))
yin=np.zeros(shape=(4,1))
y=np.zeros(shape=(4,1))
i=0
found=0
while(found==0):
  yin=x[i][0]*w[0]+x[i][1]*w[1]
  yin = yin+b
  if(yin>theta):
     y[i] = 1
  elif(yin<=theta and yin>=-theta):
     y[i]=0
  else:
     y[i]=-1
  if (y[i]==t[i]):
     print("NO UPDATION REQUIRED")
     print(y[i])
     if(i<3):
       i=i+1
     else:
       i=0
  else:
     print("MODEL IS NOT TRAINED")
     print("The value of output is")
     print(y)
     w[0]=w[0]+alpha*x[i][0]*t[i]
     w[1]=w[1]+alpha*x[i][1]*t[i]
     b = b + alpha *t[i]
     if(i<3):
       i=i+1
     else:
       i=0
  if(y==t).all():
     found=1
print("The final weight matrix is:")
print(w)
print("The final output is:")
print(y)
```

PROGRAM 20

OUTPUT:

Jupyter Untitled21 Last Checkpoint: a few seconds ago (unsaved changes)

```
